

CSE606 - Term 1 - 2026-27, IITB

Project & Report AI Disclosure Statement

Name of Student: Unnath Chittimalla

Roll Number: IMT2023620

1. Code Generation and Modification

* **Tool(s) Used:** (e.g., GitHub Copilot, ChatGPT, Claude)\

ChatGPT

* **Specific Applications:**

* ☐ None

* ☐ HTML boilerplate setup

* ☐ JavaScript event listeners (e.g., mouse interaction, window resizing)

* ☐ WebGL boilerplate (e.g., shader compilation, buffer binding templates)

* ☐ Math helper functions (e.g., matrix multiplication, vector normalization)

* ☐ GLSL Shader code debugging or generation

* **Prompts Used & Modification Level:** (Describe what you asked the AI and how much you changed the output code to fit your project.)

I mainly asked it to create the buttons and HTML layout which I then used in [main.js](#) for UI functionality purposes. I also asked it syntax and the meaning behind different WebGL function calls. I also mainly asked for the different types of WebGL drawing techniques like line, line strip, etc.. I also asked it how to make an arc or mimic the doorway shown in the pinterest image. I then asked it some JS basics, of how to detect mouse and keyboard events so I can call my functions or draw and update the scene. Converting mouse coordinates from canvas to my projected coordinate space of $x \rightarrow [-4, 4]$ and $y \rightarrow [-4, 4]$. It was also used to make the dragging logic while the mouse is held more cleaner (It gave me the idea of using a drag offset, so when i click on a region thats not centre of an object, it doesnt suddenly snap its centre to my cursor position. I also asked it for help in the regards of keeping objects within the canvas, it gave me the idea of implementing "hitboxes" or "collision-boxes", where if the objects border exceeds the boundaries, it is snapped back into canvas boundary. Lastly I asked it help for localStorage syntax so I could implement mode switching of the retrieve and save stages.

2. 3D Modeling and Assets (Blender)

* **Tool(s) Used:** (e.g., Blender AI Add-ons, Midjourney for textures, DreamUV)

* **Specific Applications:**

* ☐ None

* ☐ Mesh generation / Procedural geometry assistance

* ☐ Texture generation (e.g., seamless textures, normal maps, roughness maps)

* ☐ AI-driven denoising or baking assistance

* **Description of AI Involvement:** (Explain exactly which assets are AI-generated vs. hand-modeled, and how you edited the AI assets.)

3. Report Writing and Documentation

* **Tool(s) Used:** (e.g., ChatGPT, Claude, Grammarly Premium)

* **Specific Applications:**

* ☐ None

* ☐ Outlining the report structure and sections

- * [] Drafting technical explanations (e.g., explaining lighting models used)
- * [] Proofreading, grammar correction, and refining tone
- * [] Generating inline JSDoc or GLSL code comments

* **Description of AI Involvement:** (Specify if the AI drafted text from your raw notes, or if it was only used to polish text you wrote yourself. Note any text kept verbatim.)
The AI generated notes were from my conversation and thought process as i kept conversing with the AI, i gave it a brief list of all the functions in the code, and basic explanation of the main ones, so that it could create an easy to understand [README.md](#) file.

4. Academic Integrity & Verification

* **Core Logic & Authorship Statement:** I certify that all core WebGL rendering loops, custom shader logic, matrix transformation pipelines, and primary Blender models were engineered and verified by me. Furthermore, the analysis, conclusions, and technical evaluations presented in the report reflect my own understanding of the material. AI tools were strictly used for supplemental boilerplate, troubleshooting, and editing.
